

alteration." And Humphrey adds that
 "I hope that not much of this free
 LSD has got around. Much of the
 blame for it must go to ~~the~~ Sender &
 the FDA for their lack of a coherent
 and sensible policy." In any case he
 suggests that on no account should anyone
make use of samples of free LSD." (H.O.'s
 underlining.) If any samples turn up,

I wd prefer they were sent to me rather
 than poured down the toilet, so we can try
 them on animals and see precisely what
 reactions they produce."

In view of all this, dear Tim, please
 proceed with caution. One untoward
 reaction could imperil the entire LSD
 project.

Ever yours,
 A W W

29. v. 63

Dear Tim,
I had a letter yesterday from
Humphrey Osmond, in which, among
other things, he spoke of green LSD.
He has had information about it
from Hoffman — 60% LSD, 40%
"other adrenalin-like substances."
Hoffman doesn't yet know what
these are or why they shd be
present. Osmond goes on to say
that, if this green LSD is stable
(which Sandoz's LSD 25 is not,
when exposed to air), "one wd
expect it to produce a more
prolonged reaction. While this is
of great theoretical interest &
allows us to define a psychodelic
LSD 25 over against a psychoto-
metric LSD (green, stable), there
are immediate issues of a
disputing nature. In some
people the more prolonged reaction
cd be extremely harmful, especially
if they had no idea that it cd
occur. If it does occur, massive
hiacin & ascorbic acid wd seem
to offer the best chances of
